

PPRpix Real Photo Tips to Success

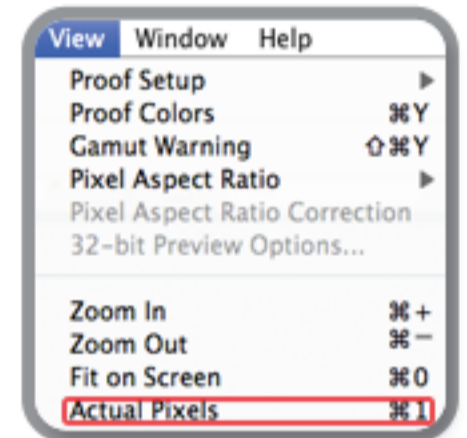

Our goal is to make the highest quality photo prints from client provided originals.

We offer you the photographer the choice of printing your images exactly as we receive them, or for \$1.00 per image in the order we review color, density and saturation and decide what Image Enhancement is best for each image.

If your original is 2000x3000 pixels or larger, or from a 6 megapixel or greater camera, you can print to any of our print sizes.

View your pixels at actual size to make sure your image is sharp.

Acceptable image file types are

rgb jpeg (standard compression only)
rgb 8 bit tiff with no layers or compression.

We recommend highest quality jpeg file.

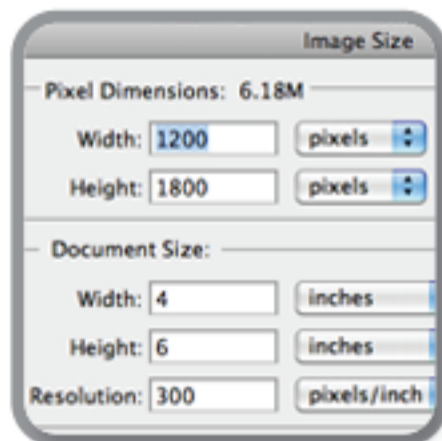

Jpeg files will transmit faster and will show no loss in quality over the same tiff file.

We also recommend sRGB as your working color space, but we are color managed and will properly convert from any working color space.

While our output DPI is 300, we resize image files as they are sent to our printers. We recommend you allow us to size your images to the output resolution. A 30x40 print at 300 dpi would require a 9000x12000 pixel image, or a 324 meg file. A highest quality jpeg from a camera capture of 2000x3000 pixels will print correctly through our processes, so let us take care of the upsizing for you.

An exception to the above is if you are printing 4x6 prints for proofing. A 4x6 requires 1200x1800 pixels which is about a .8 meg jpeg. If you are sending files larger than 1200x1800 for 4x6 you are sending a lot of wasted information and spending a huge amount of unnecessary upload time.

Another exception is if your original contains text which you created before sending to us. An original with text should be saved at a minimum 200DPI at actual size in order to assure the text is rendered in high quality.
